Patent No. 6048726
GENERAL INFORMATION:
                            APPLICANT: Weltman, Joel K.
APPLICANT: Karin, Aftab S.
TITLE OF INVENTION: INHIBITION OF EOSINOPHILIC INFLAMMATION
FILE REFERENCE: 0998/002001
CURRENT APPLICATION NUMBER: US/09/079,839
CURRENT FILING DATE: 1998-05-15
NUMBER OF SEQ ID NOS: 2
SOPTWARE: FastSEQ for Windows Version 3.0
SEQ ID NO 1
LENGTH: 16
                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

Patent No. 6559294
GRMERAL INFORMATION:
APPLICANT: Griffais, R.
TITLE OF INVENTION: Chlamydia pneumoniae genomic sequence and polypeptides, fragment;
TITLE OF INVENTION: thereof and uses thereof, in particular for the diagnosis, prev,
TITLE OF INVENTION: and treatment of infection
FILE REFERENCE: 9710-003-999
CURRENT APPLICATION NUMBER: US/09/198,452A
CURRENT APPLICATION NUMBER: US/09/198,452A
CURRENT FILING DATE: 1998-11-24
NUMBER OF SEQ ID NOS: 6849
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

The invention relates to an antisense compound of 8-30 nucleobases in length, which modulates interleukin (II)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of II-5 receptor a. The antisense compound is useful for modulating II-5 signal transduction, modulating expression of mammalian II-5 or modulating the expression of mammalian II-5 receptor a in mammalian cells or tissues, for altering the ratio of the isoforms of mammalian II-5 receptor a in mammalian cells or tissues, treating a mammalian having a disease or condition associated with II-5 signal transduction,

receptor a expression,

the disease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          S
                   length, which modulates interleukin (IL)-5 signal transduction. Also conclude are a pharmaceutical composition comprising the antisense of ligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of IL-5 receptor a. The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of mammalian IL-5 or modulating the expression of mammalian IL-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues, treating a mammalian cells or tissues, treating a mammalian cells or tissues, treating a disease or condition associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ABX04361
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 119
                                                                           The invention relates to an antisense compound of 8-30 nucleobases in length, which modulates interleukin (II)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense coligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of II-5 receptor a. The antisense compound is useful for modulating II-5 signal transduction, modulating expression of mammalian II-5 or modulating the expression of mammalian II-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian II-5 receptor a in mammalian cells or tissues, treating a mammalian chaving a disease or condition associated with II-5 signal transduction, II-5 expression or II-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding II-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human II5

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                     The invention relates to an antisense compound of 8-30 nucleobases in CC length, which modulates interleukin (II)-5 signal transduction. Also CC include are a pharmaceutical composition comprising the antisense CC oligonucleotide and a pharmaceutically acceptable carrier or diluent, and CC a diagnostic kit for detecting the expression level of the membrane form CC versus soluble form of II-5 receptor a. The antisense compound is useful CC for modulating II-5 signal transduction, modulating expression of CC mammalian II-5 or modulating the expression of mammalian II-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian CC in ference or condition associated with II-5 signal transduction, CC II-5 expression or II-5 receptor a expression, where the disease or condition associated with II-5 signal transduction, CC condition include eosinophilic syndrome or asthma. An antisense compound CC which alters splicing of an RNA encoding II-5 receptor a is also useful CC for treating a mammal having a disease or condition. The present sequence CC is an antisense oligonucleotide targetting human II5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT 120

                                                                                                                                                                                                                                                                                                                              The invention relates to an antisense compound of 8-30 nucleobases in length, which modulates interleukin (II)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of II-5 receptor a. The antisense compound is useful for modulating II-5 signal transduction, modulating expression of mammalian II-5 or modulating the expression of the isoforms of mammalian II-5 or modulating the expression of the isoforms of mammalian II-5 receptor a in mammalian cells or tissues, treating a mammalian II-5 receptor a in mammalian cells or tissues, treating a mammalian having a disease or condition associated with II-5 signal transduction, II-5 expression or II-5 receptor a expression, where the disease or condition associated or asthma in antisease or compound include a component of the content of
                                                                                                                                                                                           Sequence 20
                                                                                                                                                                                                                                    IL-5 expression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel antisense compound for treating disease/condition e.g. eosinophilic syndrome or asthma associated with interleukin-5 or IL-5 receptor expression or IL-5 signal transduction, modulates IL-5 signal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Dean
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          07-MAR-2001; 2001US-00800629
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Homo

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an antisense compound of 8-30 nucleobases in length, which modulates interleukin (II)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of II-5 receptor a. The antisense compound is useful for modulating II-5 signal transduction, modulating expression of
                                                                                                                                                                                                                                                                                                                                                                                                                                           mammalian IL-5 or modulating the expression of mammalian IL-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues, treating a mammalian having a disease or condition associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 4; Page 19; 77pp;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel antisense compound for treating disease/condition e.g. eosinophilic syndrome or asthma associated with interleukin-5 or IL-5 receptor expression or IL-5 signal transduction, modulates IL-5 signal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        07-MAR-2001; 2001US-00800629

                                                                                                                                                                The invention relates to an antisense compound of 8-30 nucleobases in clength, which modulates interleukin (II)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense coligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of II-5 receptor a. The antisense compound is useful for modulating II-5 signal transduction, modulating expression of mammalian II-5 or modulating the expression of mammalian II-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian CC in cells or tissues, for altering the ratio of the isoforms of mammalian CC in receptor a in mammalian cells or tissues, treating a mammalian CC having a disease or condition associated with II-5 signal transduction, II-5 expression or II-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding II-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
                                                                                 Query Match

Also conclude are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of IL-5 receptor a. The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of mammalian IL-5 or modulating the expression of mammalian IL-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues, treating a mammalian chaving a disease or condition associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

include are a pharmaceutical composition comprising the antisense coligonucleotide and a pharmaceuticall composition comprising the antisense coligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of IL-5 receptor a. The antisense compound is useful for modulating IL-5 or modulating the expression of mammalian IL-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues, treating a mammalian IL-5 receptor a condition associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an ANA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (DEAN/) DEAN N M.

Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of II-5 receptor a. The antisense compound is useful for modulating II-5 signal transduction, modulating expression of mammalian II-5 or modulating the expression of mammalian II-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian II-5 receptor a in mammalian cells or tissues, treating a mammalian having a disease or condition associated with II-5 signal transduction, II-5 expression or II-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding II-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human II5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

The invention relates to an antisense compound of 8-30 nucleobases in CC length, which modulates interleukin (IL)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense CC oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form CC versus soluble form of IL-5 receptor a. The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of CC mammalian IL-5 or modulating the expression of mammalian IL-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian CC in-5 receptor a in mammalian cells or tissues, treating a mammalian CC condition include eosinophilic syndrome or asthma. An antisense compound CC which alters splicing of an RNA encoding IL-5 receptor a is also useful CC for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         expression or transduction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 20; Page 19; 77pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC The invention relates to an antisense compound of 8-30 nucleobases in CC length, which modulates interleukin (II)-5 signal transduction. Also CC include are a pharmaceutical composition comprising the antisense CC oligonuclectide and a pharmaceutically acceptable carrier or diluent, and CC a diagnostic kit for detecting the expression level of the membrane form CC versus soluble form of IJ-5 receptor a. The antisense compound is useful CC for modulating II-5 signal transduction, modulating expression of CC mammalian II-5 or modulating the expression of the isoforms of mammalian CC in cells or tissues, for altering the ratio of the isoforms of mammalian CC II-5 receptor a in mammalian cells or tissues, treating a mammalian CC condition include cosinophilic syndrome or asthma. An antisense compound CC which alters splicing of an RNA encoding II-5 receptor a is also useful CC for treating a mammal having a disease or condition. The present sequence is an antisense oligonuclectide targetting human II5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

nucleobases

The invention relates to an antisense compound of 8-30 nucleobases i length, which modulates interleukin (IL)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent a diagnostic kit for detecting the expression level of the membrane versus soluble form of IL-5 receptor a. The antisense compound is us for modulating IL-5 signal transduction, modulating expression of mammalian IL-5 or modulating the expression of mammalian IL-5 recept in cells or tissues, for altering the ratio of the isoforms of mamma

diluent, and

An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           versus soluble form of IL-5 receptor a. The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of mammalian IL-5 or modulating the expression of mammalian IL-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues, treating a mammalian IL-5 receptor a in mammalian cells or tissues, treating a mammalian having a disease or condition associated with IL-5 signal transduction,
                                                                                                                                                                                                                                                                                                                     Novel antisense compound for treating disease/condition e.g. eosinophilic syndrome or asthma associated with interleukin-5 or IL-5 receptor expression or IL-5 signal transduction, modulates IL-5 signal transduction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      a diagnostic kit for detecting the expression level of the membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         US2002128216-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human;

                                           The invention relates to an antisense compound of 8-30 nucleobases in length, which modulates interleukin (II)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of II-5 receptor a. The antisense compound is useful for modulating II-5 signal transduction, modulating expression of mammalian II-5 or modulating the expression of mammalian II-5 receptor a in mammalian cells or tissues, for altering the ratio of the isoforms of mammalian II-5 receptor a in mammalian cells or tissues, trasting a mammalian having a disease or condition associated with II-5 signal transduction,
                                                                                                                                                                                                                                                                                  Novel antisense compound for treating disease/condition e.g. eosinophilic syndrome or asthma associated with interleukin-5 or IL-5 receptor expression or IL-5 signal transduction, modulates IL-5 signal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonuclectide targetting human IL5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               IL-5 receptor a in mammalian cells or tissues, treating a mammalian having a disease or condition associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor a expression, where the disease or
IL-5 expression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compwhich alters splicing of an RNA encoding IL-5 receptor a is also us
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         26-MAR-1999; 99US-00280799

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                      CC length, which modulates interleukin (IL)-5 signal transduction. Also CC include are a pharmaceutical composition comprising the antisense CC oligonucleotide and a pharmaceutically acceptable carrier or diluent, and CC a diagnostic kit for detecting the expression level of the membrane form CC expression soluble form of IL-5 receptor a. The antisense compound is useful CC for modulating IL-5 signal transduction, modulating expression of CC in cells or tissues, for altering the expression of the isoforms of mammalian CC IL-5 receptor a in mammalian cells or tissues, treating a mammalian CC IL-5 receptor a in mammalian cells or tissues, treating a mammalian CC in spression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound CC which alters splicing of an RNA encoding IL-5 receptor a is also useful CC in an antisense oligonucleotide targetting human IL5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                   (DEAN/) DEAN N M.

                                                                                                                                                     The invention relates to an antisense compound of 8-30 nucleobases in length, which modulates interleukin (II)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of II-5 receptor a. The antisense compound is useful for modulating II-5 signal transduction, modulating expression of mammalian related to tissues, treating expression of mammalian II-5 or modulating the expression of the isoforms of mammalian II-5 receptor a in mammalian calls or tissues, treating a mammalian II-5 receptor a of mammalian calls or tissues, treating a mammalian having a disease or condition associated with II-5 signal transduction, II-5 expression or II-5 receptor a expression, where the disease or combined and acceptor a expression, where the disease or combined and acceptor a expression or acceptor a mammalian compound.
                                                                                                                                                                                                                                                                                                                                                                                                                       Novel antisense compound for treating disease/condition e.g. eosinophilic syndrome or asthma associated with interleukin-5 or IL-5 receptor expression or IL-5 signal transduction, modulates IL-5 signal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; ss; antisense; interleukin 5; IL-5; IL-5 receptor; antiasthmatic; immunosuppressant; eosinophilic syndrome; asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human Interleukin 5 antisense oligonucleotide ISIS 16086
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ABX04355;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ABX04355 standard;
                                                                                          IL-5-expression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
                                                                                                                                                                                                                                                                                                                                                                                                         transduction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 2003-039602/03
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Dean
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   07-MAR-2001; 2001US-00800629

                                                                                                                                                                        versus soluble form of IL-5 receptor a. The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of mammalian IL-5 or modulating the expression of mammalian IL-5 or modulating the expression of mammalian IL-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues, treating a mammalian having a disease or condition associated with IL-5 signal transduction, IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence
                                                                                                                                                                                                                                                                                                                                       The invention relates to an antisense compound of 8-30 nucleobases in length, which modulates interleukin (II)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form

                                                                                                                                                                                                                                                                                                           Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an antisense compound of 8-30 nucleobases in clength, which modulates interleukin (II)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense coligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of IL-5 receptor a. The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of mammalian IL-5 or modulating the expression of mammalian IL-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues, treating a mammalian chaving a disease or condition associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                      condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
                                                                                                                                                                                                                                                                                                                                                                                                                versus soluble form of II-5 receptor a. The antisense compound is useful for modulating II-5 signal transduction, modulating expression of mammalian II-5 or modulating the expression of mammalian II-5 ecceptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian II-5 receptor a in mammalian cells or tissues, treating a mammalian having a disease or condition associated with II-5 signal transduction, II-5 expression or II-5 receptor a expression, where the disease or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an antisense compound of 8-30 nucleobases in length, which modulates interleukin (II)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel antisense compound for treating disease/condition e.g. eosinophilic syndrome or asthma associated with interleukin-5 or IL-5 receptor expression or IL-5 signal transduction, modulates IL-5 signal
                                                                                                                                                                                                                                                                                                                         Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      transduction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Dean NM,

                                                                                                                                                                                                                                                                                      ঠ
                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an antisense compound of 8-30 nucleobases in clength, which modulates interleukin (IL)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of IL-5 receptor a. The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of mammalian IL-5 or modulating the expression of mammalian IL-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues, treating a mammalian thaving a disease or condition associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
                                                                                                                                                                                                                                                                                                                     Query Match

```
CC The invention relates to an antisense compound of 8-30 nucleobases in CC length, which modulates interleukin (IL)-5 signal transduction. Also CC include are a pharmaceutical composition comprising the antisense CC oligonucleotide and a pharmaceutically acceptable carrier or diluent, and CC versus soluble form of IL-5 receptor a. The antisense compound is useful CC or modulating IL-5 signal transduction, modulating expression of CC mammalian IL-5 or modulating the expression of mammalian IL-5 receptor a. The artic of the isoforms of mammalian CC in cells or tissues, for altering the ratio of the isoforms of mammalian CC in-5 receptor a in mammalian cells or tissues, treating a mammalian CC IL-5 expression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound CC which alters splicing of an RNA encoding IL-5 receptor a is also useful CC for treating a mammal having a disease or condition. The present sequence CC is an antisense oligonucleotide targetting human IL5

                                                                                                                                                                                                                                                                                                                                                                                                                                                          ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an antisense compound of 8-30 nucleobases in CC length, which modulates interleukin (IL)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense coligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of IL-5 receptor a. The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of mammalian IL-5 or modulating the expression of mammalian IL-5 receptor a in cells or tissues, for altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues, treating a mammalian in the appression of the isoforms of mammalian in the forming a disease or condition associated with IL-5 signal transduction, in the expression or IL-5 receptor a expression, where the disease or condition associated with IL-5 signal transduction which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         맑
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cc length, which modulates interleukin (IL)-5 signal transduction. Also conclude are a pharmaceutical composition comprising the antisense coligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form cross soluble form of IL-5 receptor a. The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of mammalian IL-5 or modulating the expression of mammalian IL-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian CI IL-5 receptor a in mammalian cells or tissues, treating a mammalian CC IL-5 receptor a in mammalian cells or tissues, treating a mammalian CC IL-5 expression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human ILS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an antisense compound of 8-30 nucleobases in clerity, which modulates interleukin (IL)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of IL-5 receptor a. The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of mammalian IL-5 or modulating the expression of mammalian IL-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian criss or tissues, treating a mammalian conduction, and disease or condition associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor a is syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

The invention relates to an antisense compound of 8-30 nucleobases in length, which modulates interleukin (II)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of II-5 receptor a. The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of mammalian II-5 or modulating the expression of mammalian II-5 or modulating the expression of mammalian in cells or tissues, for altering the ratio of the isoforms of mammalian II-5 receptor a in mammalian cells or tissues, treating a mammalian II-5 separate or condition associated with II-5 signal transduction, the state of the disease or condition associated with II-5 signal transduction, the state of the disease or condition associated with II-5 signal transduction, the state of the disease or condition associated with II-5 signal transduction, the state of the disease or the state of the state of the disease or the state of the 
                                                                                                 IL-5 expression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5

Quantifying in vivo RNA from a biological sample for producing a medicament for treating immune related disease by determining in v levels of transcripts using nucleic acid/reverse transcription-PCR of transcripts using t mix in an automated setup. νίνο

42; 83pp; English.

The present invention relates to a method of quantifying in vivo RNA a biological sample. This involves collecting the biological sample it tube comprising a compound inhibiting RNA degradation and/or gene induction, forming a precipitate comprising nucleic acids, separating logical sample in and/or gene separating the from þ

Novel antisense compound for treating disease/condition e.g. eosinophilic syndrome or asthma associated with interleukin-5 or IL-5 receptor expression or IL-5 signal transduction, modulates IL-5 signal

XX Human
XX H និនិនិនិនិនិនិនិនិនិនិនិនិនិ 밁 S precipitate from the supernatant, dissolving the precipitate using a buffer, forming a suspension, isolating nucleic acids from the suspension using an automated device, dispersing or distributing a reagent mix for reverse transcription (RT)-PCR using an automated device, dispersing or distributing the nucleic acids isolated within the dispersed reagent mix using an automated device and determining the in vivo levels of transcripts using the nucleic acid and RT-PCR reagent mix of the previous step in an automated setup. The method is useful for monitoring or detecting changes in in vivo nucleic acids levels in a biological agent present, such as eukaryotic or prokaryotic cells, viruses or phages in a biological sample or for producing a medicament for treating immune related disease, e.g., autoimmunity, rheumatoid arthritis, multiple sclerosis, cancer, immunodeficiencies such as ADDS, allergy, graft rejection or Graft versus Host Disease. 밁 Ş

CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive, CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an CC antiinflammatory steroid in a subject, for reducing levels of adenosine CC of, or reducing sensitivity to adenosine, reducing levels of adenosine or creceptor, producing bronchodilation, increasing levels of biquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, CC lung inflammation, lung allergies, or a respiratory disease or condition. CC Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO CC at ftp.wipo.int/pub/published_pct_sequences

Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted nucleic solds associated with lung airway or lung dysfunction, and nucleic acids associated bronchodilating agent. ç

Claim 15; SEQ ID NO 10524; 763pp; English

The invention relates to a novel pharmaceutical composition, which has first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5° or 3° end genomic flanking regions, 5° and 3° intron-exon junctions, or regions within 2-10 nucleotides of 5° and 3° intron-exon junctions, or regions within 2-10 nucleotides of 5° and 3° intron-exon junctions, or regions within 2-10 nucleotides of 5° and 3° intron-exon junctions, or regions within 2-10 nucleotides of 5° and 3° intron-exon junctions, or regions within 2-10 nucleotides of 5° and 3° intron-exon junctions, or regions within 2-10 nucleotides of 5° and 3° intron-exon junctions, or regions within 2-10 nucleotides of 5° and 3° intron-exon junctions, or regions within 2-10 nucleotides of 5° and 5°

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cc reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, cc surfactant depletion or hyposecretion, when administered to a mammal. The coligonucleotides are derived from a gene encoding or regulating cx expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. C The invention also describes a kit, that comprises: (A) a delivery cx device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, cc analgesic, hypotensive, immunosuppressive and cycostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or creating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to creduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung cinflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vascoonstriction, ceptiratory confinemation, allergies, asthma, impeded respiration, respiratory confinemation, allergies, asthma, impeded respiration, respiratory confinemation, emphysema, chronic obstructive pulmonary disease, pulmonary confinemation, respiration, respiration, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system c.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

CC II-5 or II-5 receptor a, where the antisense compound modulates the CC expression of mammalian II-5 or II-5 receptor a. The antisense coligonucleotide comprises at least one modified internucleoside linkage, ci.e. a phosphorothioate linkage, or a peptide nucleic acid, at least one modified sugar moiety, i.e. a 2'-O-methoxyethyl sugar moiety, and at CC least one modified nucleobase, i.e. 5-methylcytosine. Altering the ratio cof the isoforms of mammalian II-5 receptor a in mammalian cells or CC tissues comprises contacting the cells or tissues with an antisense CC compound so that the ratio of the mammalian II-5 receptor a isoforms is CC altered. Treating a mammal having a disease or condition associated with CII-5 signal transduction or II-5 or II-5 receptor a expression, or a CC disease or condition characterised by a reduction in apoptosis comprises administering to the mammal a therapeutic or prophylactic amount of an antisense compound so that II-5 signal transduction, II-5 or 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an antisense compound that modulates interleukin -5 (IL-5) signal transduction. The antisense compound is an antisense oligonucleotide targeted to a nucleic acid molecule encoding a mammalian IL-5 or IL-5 receptor a. where the anticommunications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense compound modulating useful in promoting apoptosis and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  i.e. a phosphorothioate linkage, or a peptide nucleic acid, at least one modified sugar moiety, i.e. a 2'.O-methoxyethyl sugar molety and at least one modified nucleobase, i.e. 5-methylcytosine. Altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues comprises contacting the cells or tissues with an antisense compound so that the ratio of the mammalian IL-5 receptor a isoforms is altered. Treating a mammal having a disease or condition associated with IL-5 signal transduction or IL-5 or IL-5 receptor a expression, or a disease or condition characterised by a reduction in apoptosis comprises administering to the mammal a therapeutic or prophylactic amount of an antisense compound so that IL-5 signal transduction, IL-5 or IL-5 receptor a isoforms is altered, or expression of membrane IL-5 receptor a isoforms is altered, or expression of membrane IL-5 receptor a is modulated. The antisense compounds, methods and compositions are useful in promoting apoptosis and in treating eosinophilic syndrome and asthma. This sequence represents a human IL-5 DNA antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

The antisense compound modulates the expression of mammalian IL-5 or IL-5 receptor a. The antisense oligonucleotide comprises at least one modified internucleoside linkage, i.e. a phosphorothicate linkage, or a peptide nucleic acid at least modified ancar modifie
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            IL-5 receptor a; phosphorothioate; 2'-O-methoxyethyl s

```
CC Expression of mammalian IL-5 or IL-5 receptor a, where the antisense compound modulates the expression of mammalian IL-5 or IL-5 receptor a. The antisense coligonucleotide comprises at least one modified internucleoside linkage, ci.e. a phosphorothicate linkage, or a peptide nucleic acid, at least one modified sugar molety, i.e. a 2'-O-methoxyethyl sugar molety, and at cleast one modified nucleobase, i.e. 5-methylcycosine. Altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues comprises contacting the cells or tissues with an antisense compound so that the ratio of the mammalian IL-5 receptor a isoforms is altered. Treating a mammal having a disease or condition associated with classes or condition characterised by a reduction in apoptosis comprises administering to the mammal a therapeutic or prophylactic amount of an antisense compound so that IL-5 signal transduction, IL-5 or 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        oligonucleotide targeted to a nucleic acid molecule encoding IL-5 or IL-5 receptor a, where the antisense compound modula

                                                                                                                                                                                                                                                                                                                                                                S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an antisense compound that modulates interleukin CC -5 (IL-5) signal transduction. The antisense compound is an antisense CC oligonucleotide targeted to a nucleic acid molecule encoding a mammalian CC IL-5 or IL-5 receptor a, where the antisense compound modulates the CC expression of mammalian IL-5 or IL-5 receptor a. The antisense CC oligonucleotide comprises at least one modified internucleoside linkage, i.e. a phosphorothioate linkage, or a peptide nucleic acid, at least one modified sugar molety, i.e. a 2'-O-methoxyethyl sugar molety, and at CC least one modified nucleobase, i.e. 5-methylcytosine. Altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or CC tissues comprises contacting the cells or tissues with an antisense compound so that the ratio of the mammalian IL-5 receptor a isoforms is CC altered. Treating a mammal having a disease or condition associated with CC IL-5 signal transduction or IL-5 or IL-5 receptor a expression, or a cC disease or condition characterised by a reduction in apoptosis comprises CC administering to the mammal a therapeutic or prophylactic amount of an antisense compound so that IL-5 receptor a is modulated, the ratio of IL-5 creceptor a isoforms is altered, or expression of membrane IL-5 receptor a isoforms is altered, or expression of membrane IL-5 receptor a seguence receptor a seguence represents a human IL-5 DNA antisense and coligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                    Matches

CC IL-5 or IL-5 receptor a, where the antisense compound modulates the CC expression of mammalian IL-5 or IL-5 receptor a. The antisense CC oligonucleotide comprises at least one modified internucleoside linkage, i.e. a phosphorothicate linkage, or a peptide nucleic acid, at least one modified sugar moiety, i.e. a 2'-0-methoxyethyl sugar moiety, and at CC least one modified nucleobase, i.e. 5-methylcytosine. Altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or CC tissues comprises contacting the cells or tissues with an antisense CC compound so that the ratio of the mammalian IL-5 receptor a isoforms is altered. Treating a mammal having a disease or condition associated with CC IL-5 signal transduction or IL-5 or IL-5 receptor a expression, or a CC disease or condition characterised by a reduction in apoptosis comprises CC antisense compound so that IL-5 signal transduction, IL-5 or IL-5 cc CC receptor a expression, or IL-5 receptor a soforms is altered, or expression of membrane IL-5 or IL-5 cc cuseful in promoting apoptosis and in treating esinophilic syndrome and CC useful in promoting apoptosis and in treating esinophilic syndrome and CC oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          26-MAR-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -5 (IL-5) signal transduction. The antisense compound is an antisense oligonuclectide targeted to a nucleic acid molecule encoding a mammalian IL-5 or IL-5 receptor a, where the antisense compound modulates the expression of mammalian IL-5 or IL-5 receptor a. The antisense oligonuclectide comprises at least one modified internucleoside linkage,

                                                                                                                                                  The invention relates to an antisense compound that modulates interleukin CC -5 (II-5) signal transduction. The antisense compound is an antisense coligonucleotide targeted to a nuclecic acid molecule encoding a mammalian CC II-5 or II-5 receptor a, where the antisense compound modulates the CC expression of mammalian II-5 or II-5 receptor a. The antisense compound expression of mammalian II-5 or II-5 receptor a. The antisense condition of mammalian II-5 or II-5 receptor a. The antisense condition of mammalian II-5 receptor a in mammalian cells or CC diseast one modified nucleobase, i.e. a 2'-0-methoxyethyl sugar moiety, and at CC least one modified nucleobase, i.e. 5-methylcytosine. Altering the ratio CC of the isoforms of mammalian II-5 receptor a in mammalian cells or CC tissues comprises contacting the cells or tissues with an antisense CC compound so that the ratio of the mammalian II-5 receptor a isoforms is CC disease or condition or II-5 or II-5 receptor a expression, or a CC disease or condition characterised by a reduction in apoptosis comprises CC antisense compound so that II-5 signal transduction, II-5 or II-5 or II-5 creceptor a expression of an insense compound so that II-5 receptor a is modulated, the ratio of II-5 receptor a isoforms is altered, or expression of membrane II-5 receptor a is modulated. The antisense compounds, methods and compositions are cuseful in promoting apoptosis and in treating eosinophilic syndrome and coligonucleotide of the invention.

The invention relates to an antisense compound that modulates interleukin CC -5 (II-5) signal transduction. The antisense compound is an antisense CC oligonucleotide targeted to a nucleic acid molecule encoding a mammalian CC II-5 or II-5 receptor a, where the antisense compound modulates the CC expression of mammalian II-5 or II-5 receptor a. The antisense compound modulates the CC oligonucleotide comprises at least one modified internucleoside linkage, i.e. a phosphorothioate linkage, or a peptide nucleic acid, at least one modified sugar moiety, i.e. a 2'-0-methoxyethyl sugar moiety, and at CC least one modified nucleobase, i.e. 5-methylcytosine. Altering the ratio of the isoforms of mammalian II-5 receptor a in mammalian cells or tissues comprises contacting the cells or tissues with an antisense compound so that the ratio of the mammalian II-5 receptor a isoforms is altered. Treating a mammal having a disease or condition associated with CII-5 signal transduction or II-5 or II-5 receptor a expression, or a cc disease or condition characterised by a reduction in apoptosis comprises administering to the mammal a therapeutic or prophylactic amount of an antisense compound so that II-5 signal transduction, II-5 or II-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Dean
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (DEAN/)

```
CC oligonuclectide targeted to a nucleic acid molecule encoding a mammalian CC II-5 or II-5 receptor a, where the antisense compound modulates the CC expression of mammalian II-5 or II-5 receptor a. The antisense CC oligonuclectide comprises at least one modified internucleoside linkage, CC i.e. a phosphorothicate linkage, or a peptide nucleic acid, at least one modified sugar moiety, i.e. a 2'-0-methoxyethyl sugar moiety, and at CC least one modified nucleobase, i.e. 5-methylcytosine. Altering the ratio CC of the isoforms of mammalian II-5 receptor a in mammalian cells or tissues with an antisense CC compound so that the ratio of the mammalian II-5 receptor a in mammalian cells or tissues with an antisense is CC altered. Treating a mammal having a disease or condition associated with CI -5 signal transduction or II-5 or II-5 receptor a expression, or a condition characterised by a reduction in apoptosis comprises administering to the mammal a therapeutic or prophylactic amount of an antisense compound so that II-5 signal transduction, II-5 or II-5 creceptor a isoforms is altered, or expression of membrane II-5 receptor a isoforms is altered, or expression of membrane II-5 receptor a isoforms is altered, or expression of membrane II-5 receptor a matterions are compound to the mammal and the compositions are compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  26-MAR-1999;

                                                                              i.e. a phosphorothicate linkage, or a peptide nucleic acid, at least one modified sugar molety, i.e. a 2'.-C-methoxyethyl sugar molety, and at least one modified nucleobase, i.e. 5-methyloytosine. Altering the ratio of the isoforms of mammalian II-5 receptor a in mammalian cells or tissues comprises contacting the cells or tissues with an antisense compound so that the ratio of the mammalian II-5 receptor a isoforms is altered. Treating a mammal having a disease or condition associated with II-5 signal transduction or II-5 or II-5 receptor a expression, or a disease or condition characterised by a reduction in appotosis comprises administering to the mammal a therapeutic or prophylactic amount of an antisense compound so that II-5 signal transduction, II-5 or II-5 receptor a expression or II-5 or II-5 signal transduction.
                                                                                                                                                                                                                                                                                                                                  IL-5 or IL-5 receptor a, where the antisense compound modulates the expression of mammalian IL-5 or IL-5 receptor a. The antisense oligonucleotide comprises at least one modified internucleoside linkage,
                                                                                                                                                                                                                                                                                                                                                                            -5 (IL-5) signal transduction. The antisense compound is an a oligonucleotide targeted to a nucleic acid molecule encoding IL-5 or IL-5 receptor a, where the antisense compound modulates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; interleukin-5; IL-5; 88; antisense oligonucleotide; IL-5 receptor a; phosphorothioate; 2'.O-methoxyethyl sugar moiety; 5-methylcytosine; IL-5 signal transduction; apoptosis; eosinophilic syndrome; asthma; antiasthmatic; cytostatic.
                    receptor a expression, or IL-5 receptor a is modulated, the ratio of IL-5 receptor a isoforms is altered, or expression of membrane IL-5 receptor a is modulated. The antisense compounds, methods and compositions are
                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense compound

The invention relates to an antisense compound that modulates interleukin -5 (IL-5) signal transduction. The antisense compound is an antisense oligonucleotide targeted to a nucleic acid molecule encoding a mammalian IL-5 or IL-5 receptor a, where the antisense compound modulates the expression of mammalian IL-5 or IL-5 receptor a. The antisense oligonucleotide comprises at least one modified internucleoside linkage, i.e. a phosphorothicate linkage, or a peptide nucleic acid, at least one modified sugar molety, i.e. a 2'-O-methoxyethyl sugar moiety, and at least one modified sugar molety, i.e. a 2'-O-methoxyethyl sugar moiety, and at least one modified nucleobase, i.e. 5-methylcytosine. Altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues comprises contacting the cells or tissues with an antisense compound so that the ratio of the mammalian IL-5 receptor a isoforms is altered. Treating a mammal having a disease or condition associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              26-MAR-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             is modulated. The antisense compounds, methods and compositions are useful in promoting apoptosis and in treating eosinophilic syndrome asthma. This sequence represents a human IL-5 DNA antisense oligonucleotide of the invention.

The antiense compounds, methods and compositions are useful in promoting apoptosis and in treating eosinophilic syndrome and asthma. This sequence represents a human IL-5 DNA antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                               26-MAR-1999;

The invention relates to an antisense compound that modulates interleukin -5 (IL-5) signal transduction. The antisense compound is an antisense oligonucleotide targeted to a nucleic acid molecule encoding a mammalian IL-5 or IL-5 receptor a, where the antisense compound modulates the expression of mammalian IL-5 or IL-5 receptor a. The antisense oligonucleotide comprises at least one modified internucleoside linkage, i.e. a phosphorothicate linkage, or a peptide nucleic acid, at least one modified sugar moiety, i.e. a 2-O-methoxyethyl sugar moiety, and at least one modified nucleobase, i.e. 5-methylcytosine.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      and
                                                                                                                                   얁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0
```

The invention relates to an antisense compound that modulates interleukin -5 (IL-5) signal transduction. The antisense compound is an antisense oligonucleotide targeted to a nucleic acid molecule encoding a mammalian IL-5 or IL-5 receptor a, where the antisense compound modulates the

of mammalian IL-5 or IL-5

The invention relates to an antisense compound that modulates interleukin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC oligonucleotide comprises at least one modified internucleoside linkage, i.e. a phosphorothioate linkage, or a peptide nucleic acid, at least one modified sugar moiety, i.e. a 2'-O-methoxyethyl sugar moiety, and at CC least one modified nucleobase, i.e. 5-methylcytosine. Altering the ratio of the isoforms of mammalian II-5 receptor a in mammalian cells or CC tissues comprises contacting the cells or tissues with an antisense CC compound so that the ratio of the mammalian II-5 receptor a isoforms is CC altered. Treating a mammal having a disease or condition associated with CI II-5 signal transduction or II-5 or II-5 receptor a expression, or a CC disease or condition characterised by a reduction in apoptosis comprises CC administering to the mammal a therapeutic or prophylactic amount of an CI is modulated. The artico of II-5 signal transduction, II-5 or II-5 or CC receptor a expression, or II-5 signal transduction, II-5 or II-5 cc prophylactic amount of an CC is modulated. The antisense compounds, methods and compositions are CC useful in promoting apoptosis and in treating essinophilic syndrome and CC oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁

The antisense compound is an antisense CC oligonucleotide targeted to a nucleic acid molecule encoding a mammalian CL for IL-5 or IL-5 receptor a, where the antisense compound modulates the CC expression of mammalian IL-5 or IL-5 receptor a. The antisense confouncleotide comprises at least one modified internucleoside linkage, or a peptide nucleic acid, at least one modified sugar molety, i.e. a 2'-O-methoxyethyl sugar molety, and at CC least one modified nucleobase, i.e. 5-methylcytosine. Altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues with an antisense CC compound so that the ratio of the mammalian IL-5 receptor a isoforms is altered. Treating a mammal having a disease or condition associated with CC IL-5 signal transduction or IL-5 or IL-5 receptor a expression, or a CC disease or condition characterised by a reduction in apoptosis comprises CC andministering to the mammal a therapeutic or prophylactic amount of an C antisense compound so that IL-5 signal transduction, IL-5 or IL-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ä
